2026 Aug = 66d · Sep 26 dashed = ETA

HOW TO READ

Typhoon season = Shanghai arrival month Jun–Oct (CN East China ~95% of TCs). Peak = Jul–Sep.

Grain: one point per voyage (same ATD + schedule date). Not ticket-weighted.

2026 in-season = Jun–Aug arrivals only. Sep 2026 arrivals are still ETA (hatched / dashed).

2022–2025 dates from screenshot OCR; 2026 from typed extract. Do not mix with door-to-Dushan.

2023–2025: season was not the spike

2023 in-season +7.9d vs that year off-season, but mean stayed 53.8d — same 52–55d band as 2024.

2024–25 in-season similar or faster than off-season. 2025 peak Jul–Sep 49.9d (n=19).

ATD Jun–Oct 2025: 50.4d vs off 53.8d. Typhoon months did not stretch the lane then.

2025 in-season floor 45d, median 50d. The 83d max is one June transship, not the centre.

2026: every complete arrival is above 2025's median

In-season floor 51d > 2025 median 50d. Peak Jul–Sep mean 62.0d (n=10, 80%=69d).

Aug 2026 arrivals: mean 66.0d (n=6, 59–71). Jun ATD already 57–71d (mean 64.7, n=7) — before Jul/Aug ETAs.

Public (not our B/L IDs): Bavi / ■■ 10–13 Jul Yangshan clear-out; Baihaitun / ■■■ 8–11 Aug, 42 ships restow.

Do not treat Sep ETA ~48d as recovery. Factory 55d (80%) does not cover 2026 in-season 80% = 65d.
